ZATCA Onboarding — Company Setup Guide

A complete, step-by-step walkthrough for connecting a company to ZATCA across Sandbox, Simulation, and Production — written for a company administrator, matched exactly to the live onboarding screen.

AUDIENCE

Company Admin
/ Super Admin

ENVIRONMENTS

Sandbox ·
Simulation ·
Production

MODULE

Admin Settings →
ZATCA Phase 2

SUCCESS SIGNAL

Invoice status:
Cleared /
Reported

About the screens in this manual. The panels styled like app windows throughout this document are faithful reproductions of the real ZATCA onboarding screen — same labels, same field rules, same colors and layout as the live interface — redrawn for print clarity rather than captured as photographs. Everything they show matches the running application at the time this manual was written.

Before you start

Who can do this. Only a **Company Admin** or **Super Admin** can see and use this screen. It cannot be delegated to a staff role, even a very trusted one — there is no permission toggle for it by design, because it touches the company's cryptographic signing keys.

One important thing to un-learn first: the **Company Profile** tab has its own "VAT Number" field. That field is cosmetic only — it prints on invoice templates and shows on the company card. It is **completely separate** from ZATCA onboarding and is never sent to ZATCA. The real tax identity used for ZATCA lives inside the ZATCA wizard itself, entered independently for each of the three environments.

THE SINGLE IDEA THIS WHOLE MANUAL IS BUILT ON

Sandbox, Simulation, and Production are **three completely independent onboarding processes** for the same company. Each has its own identity, its own cryptographic key, its own certificates, and its own "done" state. Finishing Sandbox does not advance Simulation or Production even slightly — you will walk through the exact same 5 steps three separate times, once per environment, on purpose.

The three environments, in the order almost every company should actually use them:

1. **Sandbox** — a free ZATCA test environment. It uses ZATCA's own published test company identity, not yours, and every field pre-fills automatically. This is where you learn the screen and prove the pipeline works, with zero paperwork.
2. **Simulation** — ZATCA's pre-production environment. From here on you use your company's *real* registered VAT/CR and address. This is the dress rehearsal before real tax invoices go out.
3. **Production** — the live gateway. Real invoices, real tax liability, real government clearance.

Where this screen lives

Log in → open Admin Settings → left menu group "Organization & Setup" → "ZATCA Phase 2 E-Invoicing"

Make sure the correct company is selected as your active company first (top of the app) — everything on this screen applies to whichever company you currently have active. If "ZATCA Phase 2 E-Invoicing" isn't in the menu at all, your account isn't a Company Admin or Super Admin for this company.

What you're looking at before you touch anything

The page opens with a colored banner at the very top. **Read it carefully once — it is easy to misread.**

Figure 1 — the wizard's landing view: status banner, live status cards, environment selector

Below the banner, four status cards summarize live state:

- **Active for Live Processing** — which one of the three environments real invoices are currently being sent to.
- **[Environment] Onboarding State** — ● Onboarded or ● Pending Setup, for whichever environment you currently have selected below.
- **Next Sequence Counter (ICV)** and **Previous Invoice Hash (PIH)** — internal bookkeeping ZATCA requires to chain every invoice cryptographically to the one before it. You don't need to act on these.

Below that are three clickable **environment cards** — Sandbox, Simulation, Production. Clicking one switches which environment's setup you're viewing/editing (it does **not** submit invoices or change what's "live" — that's the separate "Set active" link in each card's corner).

What's genuinely different between them

TESTING

Sandbox

Uses ZATCA's own shared public test identity. Every Step 1 field pre-fills. OTP is always `123456`. No real ZATCA portal account needed. Safe to redo as many times as you like.

STAGING

Simulation

Your company's real VAT/CR/address, entered by you. Requires a real login to ZATCA's Fatoora Portal to fetch a one-time OTP. Mirrors production rules and validation, without real tax consequences.

LIVE TAX

Production

Same real-identity requirement as Simulation, but this is the official gateway — every invoice submitted here is a genuine legal filing with the Saudi tax authority.

Whichever one you're working on, the process is the identical 5-step sequence in §04 — only the answers you type in Step 1, and where the OTP in Step 3 comes from, differ.

Do this once per environment, top to bottom, in order

Click the environment card you're working on first (§02) so the wizard below is pointed at the right one, then follow these steps.

Figure 2 – the 5-step progress bar; green = complete, indigo = current

1

Company Identity & National Address

Form

Fill in your tax identity and registered address for this environment.

15-Digit VAT (TIN) Exactly 15 **start and end** with **3** (e.g. **300000000000003**).
digits, and —
this is the part
people get
wrong — it
must both

CR Number Your Commercial Registration number. Any non-empty value.

Building Number 4-digit National Address building number.

Street Name , **District** , **City** Plain text, all required.

Postal Code Exactly 5 digits.

Business Industry Category Free text, e.g. "Commerce / Retail".

Step 1 – Company Identity (Sandbox)

15-DIGIT VAT NUMBER (TIN)*	COMMERCIAL REGISTRATION (CR)
300123456700003	1010000000
BUILDING NUMBER	STREET NAME
2322	Prince Sultan
DISTRICT	CITY
Al-Murabba	Riyadh
POSTAL CODE	BUSINESS CATEGORY
23333	Commerce
Save & Continue to Step 2 →	

Figure 3 – Sandbox's Step 1, pre-filled with ZATCA's own published test identity

On **Sandbox** these are already filled in — you normally just press Save without changing anything. On **Simulation/Production** every field starts blank and must match your company's real official registration exactly.

WHAT "DONE" LOOKS LIKE

No red error text is showing, and you land on Step 2. Coming back to this environment later, your answers are still there, exactly as you left them.

2 Generate Key Pair & CSR

One click

In plain terms: this creates a private cryptographic key that will digitally sign every invoice for this environment, and packages your Step 1 details into a formal request (a "CSR") proving who that key belongs to. You only need to click the button.

Figure 4 – the generated Base64 CSR (this text is expected to look scrambled)

IF YOU CLICK THIS AGAIN LATER

If this environment already has a certificate issued, clicking Generate again warns that it **invalidates** the existing certificate and you'll have to redo Step 3 onward. Only confirm if that's genuinely what you intend.

WHAT "DONE" LOOKS LIKE

A non-empty CSR block appears, and you land on Step 3.

3

Enter OTP & Issue Compliance CSID

Real ZATCA call

An OTP (One-Time Password) is how ZATCA confirms you actually control this tax identity. This is the first step that actually contacts ZATCA's real servers.

Step 3 - OTP & Compliance CSID

ZATCA PORTAL OTP CODE

1 2 3 4 5 6

✓ Ready for ZATCA Gateway Handshake — gw-fatoora.zatca.gov.sa/e-invoicing/developer-portal

Issue Compliance CSID

Figure 5 – Sandbox's OTP defaults to 123456; Simulation/Production need a real portal OTP

On Sandbox: the OTP box already shows 123456. **On Simulation/Production:** you need a real 6-digit OTP from ZATCA's Fatoora Portal (see §06) — valid ~1 hour, single-use.

WHAT "DONE" LOOKS LIKE

A green success message naming a Request ID appears, and you land on Step 4.

4 Run the Compliance Test Suite

Real ZATCA call

Sends two genuine sample invoices to ZATCA — one Standard (B2B) and one Simplified (B2C) — and asks ZATCA to check them. Mandatory before this environment can go live.

Figure 6 – a passing suite; Credit/Debit Note are honestly reported as not built yet, not faked

Once the two real tests both clear, [Upgrade to Production CSID](#) becomes clickable.

WHAT "DONE" LOOKS LIKE

The button is enabled and you're able to click through to Step 5. If a test doesn't clear, the exact rejection detail is shown — fix the underlying data and re-run; it can be re-run as many times as needed.

5**Production CSID (onboarding complete)****Finish line**

Despite the name, this step runs for **every** environment, including Sandbox — ZATCA issues the final certificate this environment will use to sign real invoices from now on.

Figure 7 – the completion panel shown for whichever environment you just finished

WHAT "DONE" LOOKS LIKE

The green confirmation panel is showing, and this environment now shows a green

● **Onboarded** badge on its card back in §02.

Repeat all five steps for each remaining environment you plan to use — each environment's progress is saved independently and waits exactly where you left it.

One message in Step 5 that looks like an error but isn't

ZATCA's Sandbox is deliberately "static" — every company's sandbox onboarding gets issued the exact same test certificate, tied to ZATCA's own shared test identity, no matter what you typed in Step 1. This app detects that and automatically adjusts to make it work correctly.

EXPECTED, NOT AN ERROR

"Production CSID activated for sandbox. ZATCA returned its known static test certificate, so this environment's signing key was switched to ZATCA's own matching sample private key — invoices will now sign correctly and validate cleanly."

This is the app correctly handling a documented ZATCA sandbox quirk, not a fault. Onboarding is genuinely complete. This adjustment applies to Sandbox only and never touches Simulation or Production.

The one step that happens outside this app

Steps 1, 2, 4, and 5 all happen entirely inside this app. Step 3's OTP is the one exception — for Simulation and Production, that code has to come from a real login to ZATCA's own Fatoora Portal, because it's ZATCA confirming you actually control the real company identity you entered in Step 1.

1. Log in to ZATCA's Fatoora Portal using your company's real ZATCA/government credentials (outside this app).
2. Find the option to onboard a new e-invoicing solution / generate an onboarding OTP for the environment you're working on. ZATCA's own portal screens are the authority on exact wording — they can change independently of this app.
3. Copy the 6-digit code shown. Valid for roughly one hour, single-use.
4. Immediately switch back to this app's Step 3, paste the code, and press  right away.

A SUBTLETY WORTH KNOWING BEFORE YOU START STEP 2

The CSR generated in Step 2 only stays available in your browser for the current session. If you refresh the page or come back later, Step 3 will refuse to submit and tell you to regenerate it — this protects a real, single-use OTP from being wasted on a stale request. Do Step 2 and Step 3 back-to-back in one sitting.

Everything else genuinely, cryptographically belongs to your company for these two environments — there is no shared/static identity trick here the way there is for Sandbox; a real mismatch is a real problem and the app refuses to silently proceed.

Onboarded is not the same as "in use"

Completing the 5 steps for an environment does **not** automatically start sending real invoices there. A separate switch controls which single environment new invoices actually go to. Once an environment shows ● Onboarded, a "**Set active**" link appears on its card.

GUARD RAIL — READ THIS EITHER WAY

You cannot set an environment active until it shows ● Onboarded — the app rejects the attempt with a clear message. There is no way to accidentally send real invoices to an environment that hasn't finished the 5 steps.

THE ONE GOTCHA THAT CAN MAKE INVOICES SILENTLY DO NOTHING

A separate, company-wide "**ZATCA Integration**" switch (Admin Settings → Companies Directory, Super Admin only) turns on **automatically** the moment a company finishes onboarding **Sandbox** for the first time. **If a company's first completed environment is Simulation or Production instead**, this switch is never auto-enabled — every invoice sits at DISABLED with zero calls attempted, even though onboarding looks complete. If that's your situation, ask a Super Admin to check this toggle before concluding something is broken.

The actual pass/fail test

Onboarding is only real proof once a genuine invoice clears through it.

1. Make sure the customer has the right details on file: a **B2B** customer needs a full ZATCA identity — VAT, building number, street, district, city, postal code. A **B2C** customer only needs a name.
2. Create a normal invoice for that customer as you always would (Invoices or POS).
3. Saving finishes instantly on screen — ZATCA submission happens moments later in the background. Reopen the invoice after a few seconds to see the result.
4. Read the ZATCA status:
 - **Cleared** (B2B) or **Reported** (B2C) — **success**.
 - **Rejected** — open the ZATCA detail panel for the specific reason and correct it.
 - **Not Submitted** — see §07's crit callout; the company-wide switch is very likely off.

Messages you might see, and exactly what they mean

“VAT/TIN must be exactly 15 digits, starting and ending with 3.”

Step 1 rejection. Check the last digit, not just the first.

“No CSR is loaded in this session. Go back to Step 2...”

You reached Step 3 after refreshing or returning later. Go back to Step 2, generate again, then continue straight through.

“[ENVIRONMENT] already has an issued CSID...”

A confirmation dialog, not an error. Only proceed if you want to redo Step 3 onward.

“ZATCA issued a certificate that does not match this environment’s private key.”

On Simulation/Production, a real problem the app caught and refused to accept — nothing was saved. Retry; if it repeats, it needs investigation by whoever maintains the app.

“[ENVIRONMENT] has not completed onboarding yet — cannot set it as active.”

Finish all 5 steps for that environment first.

An invoice sits at “Not Submitted” indefinitely.

Almost always the company-wide ZATCA Integration switch (§07). Have a Super Admin check it.

A B2B customer’s invoice never attempts ZATCA submission.

The customer record is missing a required field. Complete the ZATCA identity fields on the customer, then resend.

One page per environment

— check these off as you go

#	ACTION	ENVIRONMENT	DONE WHEN
0	Correct company selected as active	Once	Company name shown matches the one you intend to onboard
1	Step 1 identity saved	Per env.	No red errors; "Continue to Step 2" was clicked
2	Keypair & CSR generated	Per env.	Base64 text block visible
3	OTP obtained (Sim/Prod: real Fatoora Portal)	Per env.	6-digit code entered
4	Compliance CSID issued	Per env.	Green success + Request ID shown
5	Compliance test suite passed	Per env.	Both real tests CLEARED/REPORTED
6	Production CSID issued	Per env.	"Fully Onboarded" panel shown; badge turns green
7	Environment set active	Once, when ready	"Active for Live Processing" card shows it
8	ZATCA Integration switch confirmed on	Once, if needed	Companies Directory shows "Enabled"
9	Real invoice sent and checked	Once per env.	Status reads Cleared or Reported

Appendix — access & data, in plain terms

Only Company Admins and Super Admins can view or edit ZATCA onboarding for a company.

Sandbox, Simulation, and Production each store a completely separate identity, private key, and certificate.

The OTP typed in Step 3 is used once, immediately, and is never saved anywhere by the app.

Every company's ZATCA data is fully isolated from every other company on the Warraq platform.

This manual reflects the onboarding screen exactly as built at the time of writing. If the live screen ever visibly differs from what's described here, trust the screen, and flag the difference so this manual can be corrected.
